Six Steps for Fire Safety During Construction

This document has been reproduced in its entirety and with permission from the Center for the Polyurethanes Industry of the American Chemistry Council. July 2007

Fire

is a serious concern during construction, repair and retrofit projects because there may be exposed polyurethane/polyisocyanurate foam and the potential for exposure to open flame from welding and cutting torches from allied trades during certain construction sequences. While fires involving polyurethane/polyisocyanurate foam during construction

are rare, they do happen and steps can be taken to help prevent these accidents. The following safety precautions are suggested for the construction site. However, if a fire does occur and cannot be extinguished immediately, evacuate the area at once.

Contractor:

- Conduct job safety meetings with other trades before, during and after polyurethane or polyisocyanurate application.
- If foam insulation is being installed near potential ignition sources, a fire watch is required (see following section for applicability).
- Provide warning signs and labels on the job site where the trades performing hot work are most likely to see them.
- Schedule thermal barrier application as soon as practically possible.
- Keep other trades from working in the application area until a thermal barrier is applied over the foam. If another trade must work in the area before the thermal barrier is applied, they should determine if a fire watch is required (see following section for applicability).

If repair or retrofit projects expose polyurethane/polyisocyanurate foam, follow the same fire prevention procedures as for new construction.

Trade Performing “Hot Work”:

- “Hot work” permits must be authorized by an individual designated by management and only after a “hot work” assessment has been completed. The person performing the “hot work” is not authorized to make such assessments or issue permits.
- Thoroughly educate other trades on the site about fire characteristics of polyurethane or polyisocyanurate foam.
- If possible, perform “hot work” in a designated area free of combustibles. “hot work” must be performed in an area where there are combustibles: If possible, move the combustibles a distance of at least 35 feet from the “hot work.” If the combustibles cannot be moved, shield the combustibles with a fire retardant cover.
A fire watch is required where: combustible building materials or contents are closer than 35 feet to the point of operation; wall or floor openings within a 35-foot radius expose

combustible materials in adjacent areas, including concealed spaces in walls or floors; combustible materials are adjacent to the opposite side of partitions, walls, ceilings, or roofs and are likely to be ignited; or any other criteria are applicable as listed by OSHA under 29 CFR § 1910.752.

All Trades:

If a fire occurs that cannot be extinguished immediately, evacuate the area at once.

Have an adequate supply of fire extinguishers in convenient locations. Personnel that use extinguishers must be trained in their use. (Note: Around polyurethane and polyisocyanurate foam, extinguisher operators should know how to use CO₂ and dry chemical extinguishers.)

Waste materials (such as foam trim, paper, solvent, etc.) should be disposed of daily in a designated location with due regard for their combustibility characteristics.

Additional Fire Safety Information:

Rigid polyurethane or polyisocyanurate foams will, if ignited, release various products of combustion such as smoke and gases that may be irritating, flammable and/or toxic. As with other organic materials, such as wood, the primary combustible gases are carbon dioxide and carbon monoxide.

Six Steps for Fire Safety During Construction

1

Meet

Conduct a safety meeting with other trades

2

Post

Put up warning signs at the site

3

Move

Move combustibles away from the "hot work" site

4

Shield

Shield combustibles with fire blanket or welder's blanket

5

Watch

Provide fire watch. Have appropriate fire extinguisher and telephone nearby. Evacuate area if fire cannot be extinguished immediately.

6

Protect

Protect installed foam with a thermal barrier such as 1/2" gypsum board as soon as possible.
